Bulletin 82-1 October 1982

"Printed by authority of the State of Illinois"
October 1982, 4,500, 2524

FOREWORD

This annual summary of Illinois Agricultural Statistics presents a summary of the various reports prepared and published by the Illinois Cooperative Crop Reporting Service plus selected other data series of general interest. Data for the years 1975-81 and 1982, when available, are presented for most items.

Official State estimates are included in this summary for all data items. In addition, crop reporting district and county estimates are included for major crop and livestock items.

Some of the estimates presented in this publication were prepared from State financed surveys. Funds and personnel in the Illinois and United States Departments of Agriculture are pooled in the Cooperative Crop Reporting Service in order to better serve the needs of those interested in agricultural statistics.

The Crop Reporting Service wishes to express its appreciation to the many thousands of farmers and business firms who contribute every year to provide the basis of our estimates. Only the faithful service of the corps of reporters and other cooperators makes these estimates possible.

GENERAL ILLINOIS INFORMATION

This first section of the Annual Summary presents a long time history of changes in Illinois' total population, farm population, number of farms and land in farms. In addition, general information about the climate of Illinois is included. The map and explanation below of Crop Reporting Districts is also presented to aid in understanding the detailed data in this report.

CROP REPORTING DISTRICTS

For statistical purposes the counties of Illinois are grouped into nine Crop Reporting Districts (shown on the map at right). These groupings represent divisions of approximately equal size with similar soils, growing conditions and types of farming.

Crop Reporting Districts are used in the compilation of most reports. It is not possible to collect sufficient data for each county to make county estimates on a timely basis. It is possible to summarize data at a district level and weight districts together by production percentages to arrive at the best State estimates.

Many data series in this bulletin present estimates for Crop Reporting Districts. Some series are further broken down into county estimates within districts.

CLIMATE OF ILLINOIS

Illinois lies midway between the Continental Divide and the Atlantic Ocean and some 500 miles north of the Gulf of Mexico. The climate is typically continental with cold winters, warm summers, and frequent short period fluctuations of temperature, humidity, cloudiness and wind direction. The excellent soil and well distributed annual precipitation of 32 to 48 inches favor a very high standard of agricultural production.

Storm systems move through the State most frequently during the winter and spring months, and cause a maximum of cloudiness during these seasons. Sunshine averages more than 70% of possible during the three summer months, and precipitation occurs mostly during short duration showers or thunderstorms.

Illinois extends nearly 400 miles from north to south and winter temperatures show a contrast of approximately 14°F in mean temperature. Temperatures reach zero or below on an average of seven days annually in the extreme north and only one or less in the far south. The lowest temperature of record is -35°F at Mt. Carroll on January 22, 1930.

The north-south mean temperature range in July is only about 6°F as both sunshine and temperature are more uniform. Temperatures reach 90°F or higher on an average of near 20 days annually in the north and about 50 days in the south and west-central. The highest temperature of record is 117°F at East St. Louis on July 14, 1954.

Latitude is the major factor in both temperature and precipitation with the northern counties averaging cooler and drier than the south. Distance from the Gulf of Mexico and lower air mass temperatures both tend to reduce precipitation in the north. Annual precipitation is approximately 1½ times as great in the extreme south as in the extreme north, but most of the excess in the south falls during winter and early spring. Average total precipitation for December through March in the extreme southeast is about twice that in the extreme northwest. Precipitation during the warm season is more uniform and the annual average for April through September ranges from 21 to 24 inches throughout the State.

Precipitation during fall, winter, and spring tends to fall uniformly over large areas. In contrast, summer precipitation occurs principally as brief showers or thunderstorms, affecting relatively small areas. This erratic occurrence of summer showers generally results in an uneven distribution.

The annual average snowfall ranges from near 30 inches in the extreme north to only 10 inches in the extreme south. The most likely form of winter precipitation in the north is snow. More than 90% of Cairo's winter precipitation falls as rain. Snowfalls of 1 inch or more occur on an average of 10 to 12 days per year in the extreme north and decrease to 3 or 4 in the far south. Snow cover of an inch or more averages about 50 days annually in the north and only about 15 in the south.

Thunderstorms average about 35 to 50 annually, but most are quite harmless. On occasion they provide the source for hail, damaging winds, and tornadoes. Hail falls on an average of two or three days annually in the same locality, but only about once every two years during periods when crops are most susceptible to damage. Not all hailstorms have stones of sufficient size or quantity to cause major crop damage.

The mean freeze-free period ranges from less than 155 days in the extreme north to more than 210 days in the extreme south. The mean date of the last spring freeze ranges from April 5 in the extreme south, to May 5 in the extreme north. The mean date of the first fall freeze ranges from October 5 in the extreme northwest to October 25 in the extreme south. Most crop damaging freezes are radiational, that is, they occur under conditions of clear skies and light winds rather than through cold air invasion of the area.

#First fall freeze averages approximately 10 days later in Cook Co. near Lake Michigan.

Dates given are average for the district. Locations within the district having similar exposure usually agree within plus or minus five days. Crop damaging freezes are most often associated with radiation freezes. Under such conditions, clear skies and light winds, the temperature may vary 10°F or more at adjacent ridge and valley locations. Tables are based on temperatures in a standard Weather Service thermometer shelter at an approximate height of five feet above ground. Under best radiational conditions the temperature will be lower at ground level.

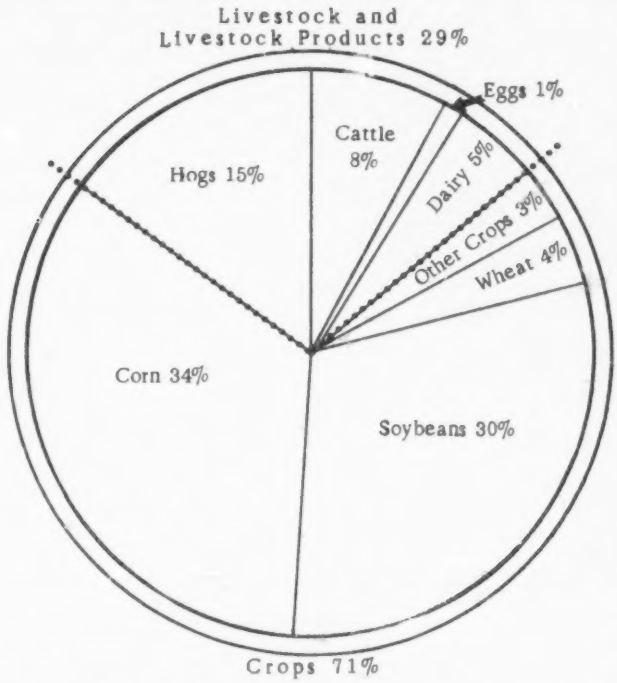
FARM INCOME

ILLINOIS CASH FARM INCOME BY COMMODITIES 1981



TOTAL CASH RECEIPTS DECREASE 4 PERCENT

Corn and soybeans provided the two largest sources of cash receipts to farmers during 1981. Corn sales accounted for 34% of the total cash receipts, the same as in 1980. Soybeans accounted for 30% of the total cash receipts in 1981, also unchanged from 1980.

Cash receipts by Illinois for all commodities totaled 7.64 billion dollars, down 4% from 1980. Receipts from crops were down 4% from 1980. The two major crops of corn and soybeans were down while all other field crops were up from 1980. Livestock receipts decreased 4% from last year, totaling 2.22 billion dollars. Increases were noted in all major livestock categories except cattle and calves, which showed a 27% decrease from 1980. Cash receipts for crops accounted for 71% of the total cash receipts in 1981, compared with 71% in 1980 and 66% in 1979.

ILLINOIS LEADING EXPORTING STATE

EXPORT SHARES FY81

Commodity	U. S. total	Illinois share	Percent of U.S. total	Illinois' rank among States
	- Million dollars -			
All commodities	43,788.5	3,622.0	8.3	2 *
Feed grains and products	11,149.8	1,772.2	15.9	2 *
Soybeans and products	8,038.9	1,390.1	17.3	2 *

* Export Shares are determined by USDA formula based on production and sales, which does not accurately reflect actual flow of commodities for export. A recent study which does trace the flow of commodities places Illinois as the Number One agricultural exporting state.

TOTAL NET FARM INCOME UP SHARPLY FROM 1980

Total net farm income of Illinois farmers in 1981 increased 291% from 1980, but was down 19% from the 1979 level. The total net income per farm was $15,276 compared to $3,907 in 1980 and $18,636 in 1979.

The 1981 realized net farm income (amount left after deducting farm production expenses from realized gross farm income) was 54% less than in 1980 and 32% less than in 1979, due in large part to the continued increase in farm production expenses. Gross farm income in 1981 declined 2% from 1980, primarily because of lower farm prices for many major farm commodities in 1981.

FIELD AND SEED CROPS

1981 CROP PRODUCTION INDEX UP SHARPLY

Illinois' 1981 "All-Crop Production Index" was 114% of its 1977 base. This was 22 percentage points (24%) above 1980, but one percentage point below the record level in 1979. A record corn and wheat crop along with the second best soybean crop in Illinois history accounted for the high level in the Index.

Illinois farmers harvested 24,110,000 acres of crops in 1981 compared with 24,004,000 acres in 1980 and 23,827,000 acres in 1979. The increase in acres during 1981 can be partially attributed to an increase in acres doublecropped following wheat.

The table below shows the "All Crop Production Index" with the base period, 1977=100.

ALL CROP PRODUCTION INDEX, 1960-81

Year	1977=100	Year	1977=100	Year	1977=100
1960	58	1968	74	1976	95

CROP DEVELOPMENT and WEATHER 1981

1981 CROP DEVELOPMENT

Weather during 1981 was generally wet while temperatures were near normal over the State. Small grains were very good over most of the State and row crops were also well above average. Record yields for Illinois were established for wheat and corn while oats tied a record. Soybean yields were one bushel per acre less than the record set in 1979. Unseasonably warm and dry weather from the last of February through the first of May allowed small grain seeding and row crop tillage to be completed ahead of schedule. Fieldwork was virtually complete by the middle of May. However, heavy and frequent thunderstorms during May delayed the completion of corn and soybean planting until later than normal.

The 1981 winter wheat crop was planted at a faster than normal pace and came through the 1980-81 winter in good condition. Growing conditions were very good during early spring through mid-summer harvest. Harvest was virtually complete by mid-July. Frequent rains and flooding delayed harvest and caused some crop abandonment in low-lying areas.

Corn planting began during the last week of April which is about average for the State. Dry soil conditions limited the acres planted early and then frequent heavy rains during May and early June delayed completion of planting until mid-June. Adequate rainfall and cooler than normal temperatures throughout the growing season caused excellent crop development. Harvest conditions were also very good as a period of warm, dry weather helped the crop mature late in the season. Completion of harvest was delayed until the end of November as the late planting and extended growing season delayed the crop from maturing uniformly.

Soybean planting progressed slower than average as delayed corn planting and continued rains kept farmers out of the soybean fields. Planting was completed during the first week of July. Crop development was also behind normal as harvest began around the last week of September and was not complete until the later part of November.

Oats seeding began the first part of March, which is way ahead of normal and seeding was virtually complete by mid-April. Growing conditions were very good as abundant moisture and cool temperatures produced a record yield. Harvest was about normal as cool temperatures delayed crop maturity. Excess rains and soft field conditions delayed harvest in some areas. Field losses were heavy in some areas as heavy rains threshed some grain in the field before harvest. Harvest was complete by about mid-August.

The hay crop varied across the State as frequent rains prevented adequate curing in some areas and some hay was repeatedly rained on. Yields were average but quality suffered from excess rain causing some hay to mold in the field, and much of the acreage needed turning to aid drying. First cutting was complete by the end of June and 2nd and 3rd cuttings of alfalfa were harvested on schedule.

Seeding of the 1982 winter wheat crop began around mid-September and was not complete until the end of November. The delayed harvest of corn and soybeans extended the wheat planting period. The seedings were made under mostly good conditions. The southern districts were lacking in moisture during September and most of October but rains during late October and November brought soil moisture to adequate levels. Plowing for 1982 corn and soybean acreage progressed behind normal but was about 68% complete by the end of 1981, about normal for fall plowing.

1981 WEATHER

Precipitation: From January through March the southern half of the State continued in drought, a condition which began in spring of the year before. During April, spring showers and thunderstorms commenced, and brought above normal precipitation to essentially the entire State but particularly Central and Southern Illinois. The 1981 precipitation in Illinois ranged from normal in extreme Southern Illinois, to well above normal in all other portions; such that 1981 was the seventh wettest year of this Century. The State average precipitation was 13% above normal, and 1981 marked the ninth year in the past 11 years, with above normal precipitation. The actual amounts of precipitation over the State varied from about 35 inches in the North-central to 48 inches in the central counties, to about 37 inches in the South-central, increasing to about 46 inches in the far South.

Temperatures: Mean 1981 temperatures in Illinois were close to normal. Lowest temperatures were found in the northwestern part of the State, with the warmest in the extreme South, a normal distribution. The whole State was near normal in annual temperature, with the greatest deviations being about +1 degrees F at Springfield and Peoria. The summer of 1981 was cooler than normal, whereas the colder months were warmer than normal. Heating degree days were very close to normal in Southern Illinois, about 500 less than normal in Central Illinois and between 200 and 400 less than normal in Northern Illinois. Cooling degree days were about 100 less than normal in Central Illinois and about 200 less than normal in Northern and Southern Illinois.

Growing Degree Days: Growing degree days (base: 55 degrees F) were similar to the distribution of mean annual temperature. Total growing degree days were about 2500 in the far Northwest, increasing to about 3300 in Central Illinois and 4500 in the extreme South.

General Discussion of 1981 Weather: January thru March were relatively dry (particularly in the South) throughout the State with only one major snowfall in February. From the 3rd to the 5th of April, most of the State was subjected to thunderstorms, strong winds and some hail and a few tornadoes. On the 10th and 13th additional storms moved across the State, with 1 3/4" hail reported at Peoria and Rock Island, and at least 6 tornadoes were sited.

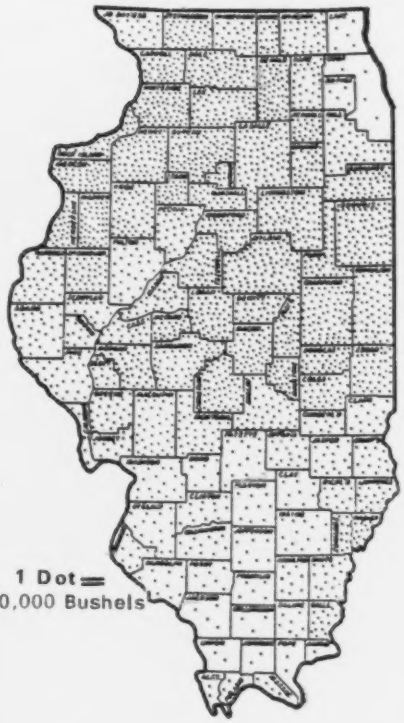
The increasing rainfall in May commenced a series of floods which affected many parts of the State. Heavy rains in most areas continued through September. In August and September, flood occurrences were noted most often in the northern two-thirds of the State.

A few tornadoes, hail and windstorms were noted on June 8 and 9 and again on June 20 and 21. Again, between the 13th to the 20th of July, several strong windstorms were observed. Tornadoes were observed on July 25 and 28 and again on August 25. 1981 was one of the wettest summers on record for many parts of Central and Northern Illinois.

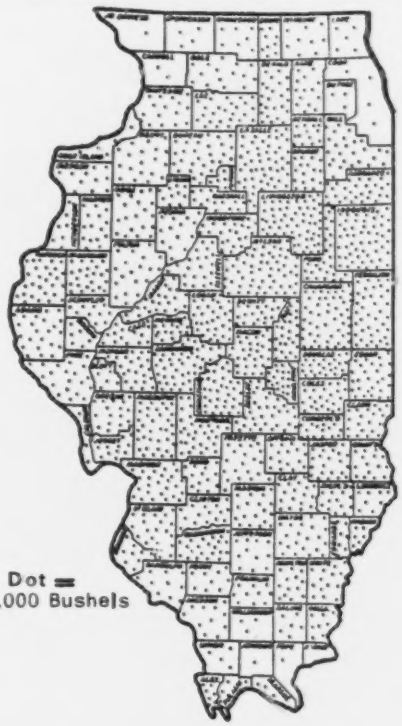
Winter began with three storms in mid-December which moved parallel to the Ohio River and dumped heavy snow in Central Illinois. The first occurred on the 16th and 17th, with the heaviest snowfall from Springfield to Champaign. The second storm (December 22) deposited a heavy, wet band of snow through Central Illinois. The third storm (December 27 and 28) produced heaviest accumulations in West-central Illinois. These three storms were the beginning of what is now known as another severe winter in the State of Illinois.

DISTRIBUTION OF MAJOR CROPS

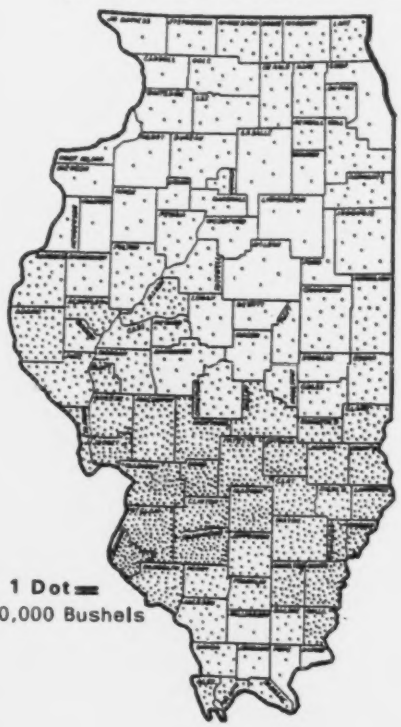
CORN PRODUCTION – 1981



SOYBEAN PRODUCTION – 1981



WHEAT PRODUCTION – 1981



OAT PRODUCTION – 1981

CROP DEVELOPMENT and VARIETY INFORMATION

Crop development information is collected and published each week during the crop preparation and growing season in the Weekly Weather - Crop Bulletin. In this section, planting and harvesting information for major crops is summarized along with selected information on crop maturity.

Also included in this section are data on leading varieties of soybeans and wheat; and planting and harvesting methods for corn.

FRUIT

1981 PEACH PRODUCTION

Peach production in Illinois for 1981 was estimated at 22 million pounds (458,000 bushels, 48-pound equivalents), 8% below the crop in 1980 but 47% above the 15 million pounds produced in 1979. Value of the 1981 crop totaled $4,708,000, up 6% from the 1980 value of $4,440,000. The increase in value is attributable to a higher price during 1981 than 1980. The 1981 average price per pound was 21.4 cents compared to 18.5 cents for the 1980 crop.

Mild winter weather allowed the peach orchards to come thru the winter in good condition in the North and good to excellent condition in the South. There was some frost damage to trees in West-Central Illinois. Growers reported the crop in generally good condition during the growing season. Some localized damage resulted from hail and windstorms in the summer. The wet weather throughout the summer caused some disease problems but both size and quality were better than average.

1981 APPLE PRODUCTION

Illinois commercial apple production totaled 103 million pounds (2.5 million bushels, 42-pound equivalents) in 1981. Production was up 2% from the 101 million pounds in 1980 but was down 6% from 1979's production. Golden Delicious still remained the leading variety, accounting for 32% of the crop, with Jonathan a close second at 30% and Red Delicious at 24%. Total value of the 1981 crop is estimated at $13,184,000, 8% more than 1980's crop. Total crop value was up due to both a higher production and a higher price per pound. The average price per pound in 1981 was 12.8 cents compared to 12.1 cents in 1980 and 12.4 cents in 1979.

Illinois apple orchards came thru the winter in good condition. Minor crop damage occurred in the northern areas from winter and spring freezes. Some crop variability developed due to hail and windstorm damage, mainly in the southern part of the State. Late summer rainfall and moderate temperatures caused excellent crop development in the central and southern growing areas.

VEGETABLES

1981 PROCESSING SUMMARY

Total 1981 production of the principal processing vegetables (green peas, sweet corn, snap beans, and tomatoes) is estimated at 287,620 tons, up 19% from last year's 241,740 tons. The area harvested is estimated at 62,800 acres, down 3,900 acres (6%) from last year. Higher yields more than offset a reduction in acreage for an overall increase in production during 1981 when compared with 1980. Value of the processing crops in 1981 is estimated at $30.0 million, up $5.5 million (22%) from $24.5 million in 1980. Estimates for snap beans, green peas and tomatoes for processing are not published separately in order to avoid disclosing individual operations.

1981 FRESH MARKET SUMMARY

Total production of the principal fresh market vegetables (fresh and processed asparagus, fresh market cabbage and sweet corn) in 1981 is estimated at 574,000 cwt., up 7% from last year's production of 536,000 cwt. Harvested area of 7,700 acres was down from 1980 when it was 8,000 acres. Higher yield levels in 1981 contributed primarily to the increase in production compared to 1980. Value of the crops was estimated at $6.3 million, a decrease of 6% from last year's $6.7 million. Prices per cwt. were lower for both sweet corn and cabbage but higher for asparagus than last year's prices.

FLOWERS AND FOLIAGE PLANTS

TOTAL VALUE OF FLOWERS AND FOLIAGE PLANTS UP

Gross wholesale value of sales of selected flower types (cut and potted), foliage and bedding plants in 1981 by Illinois commercial producers was $27.3 million, 14% more than the $23.9 million value of gross wholesale sales during 1980. The gross wholesale value for cut flowers was up 4% from 1980 as all surveyed types showed increases except standard chrysanthemums and gladioli. Wholesale value for potted flowering plants and bedding plants increased 17% from 1980 even though a smaller square footage of all types were planted except for chrysanthemums and lilies. The wholesale price per unit for cut flowers in 1981 was higher than in 1980 for all types except gladioli. Wholesale prices for potted flowering plants, foliage plants and bedding plants were all up from 1980 prices. Volumes sold for most cut flower types were higher in 1981 than in 1980. Volume of sales for most potted plants were also up during 1981 compared to 1980. Potted chrysanthemums and geraniums had a smaller volume of sales in 1981. Volume of flowering bedding plants were up during 1981 while units of vegetable bedding plants were down compared to 1980.

Net value of sales in 1981 of foliage plants for indoor or patio use was $3.8 million, up 13% from 1980 when it was 3.4 million. The 1981 area in production was also up, totaling 880,000 square feet compared with 823,000 square feet in 1980, an increase of 7%.

The Illinois Cooperative Crop Reporting Service began making official estimates in 1976 for the production of snapdragons, potted poinsettias, potted geraniums, potted lilies, potted hydrangeas, and flowering or vegetable bedding plants. Thus no production figures are available for these items prior to this time.

LIVESTOCK AND POULTRY

The inventory of sheep and lambs on January 1, 1982 rose 6% to 195,000 head, the highest level since 1975. Value per head was $60.00, down $12.00 from a year earlier. Total inventory value, at $11,700,000, was 12% below the previous year.

Chickens (excluding broilers) on farms December 1, 1981 were estimated at 6,100,000, an 11% drop from the year earlier count. The inventory reduction was only partially offset by a 10-cent increase in value per head, to $1.65, resulting in total inventory value dropping to $10,065,000, 5% below a year earlier.

For the livestock and poultry included in these estimates, cattle accounted for 70% of the total value at the beginning of 1982, no change from 1981.

The total value of all Illinois cattle, hogs, sheep and chickens (excluding broilers) at the beginning of 1982 was 1,610 billion dollars, a decrease of 7% from a year earlier.

The number of cattle and calves in Illinois on January 1, 1982 was 2,800,000 head, 6% more than a year earlier. A $55 decrease in value per head, to $405, lowered the inventory value of the State's herd 7%, to $1,134,000,000.

There were 6,450,000 hogs and pigs on hand December 1, 1981, down 150,000 head, or 3%, from the previous year. The drop in inventory combined with a decrease of $4.00 in value per head, to $70.50, resulted in a total value of the swine herd at $454,725,000, down 7%.

VALUE OF LIVESTOCK INVENTORY - FIRST OF THE YEAR, 1960-1982 (INCLUDES ALL CATTLE AND ALL SHEEP--JAN. 1 AND ALL HOGS, CHICKENS AND TURKEY BREEDERS--DEC. 1 PRECEDING YEAR)

PRICES

1981 Crop and Livestock Indexes

The Illinois Prices Received Index has been computed from 1956 to the present using new quantity weights each year. The Illinois Index relies on weights based on the average value and quantity of each commodity sold during a previous 5-year period.

The all farm products index of prices received by Illinois farmers in 1981 was 124% of the base period, 1975 through 1979, 3 points above the 1980 index and 9 above 1979. This increase was mainly due to the relatively high prices the farmers received for their crops during the early months of 1981. Prices received by farmers for all commodities were fairly stable in 1981 until August. Then prices dropped, as big corn and soybean crops awaited harvest, and continued downward the rest of the year.

Crop prices were up from 1980 with the biggest increases shown early in the year, but prices dropped as harvest came in the fall reaching a low in November. The crop index at 125 was 7 points higher than the crop index for 1980. The prices received index for livestock at 123 was 2 points less than 1980. Livestock prices fluctuated throughout the year hitting a season high in July and September and a season low in December.

1/ Annual average is for December previous year through November current year.

PRICES PAID

Prices paid by farmers for major production items are collected from dealers and merchants at regularly recurring intervals by means of mailed inquiries and personal interviews. This information provides a historical series of prices paid for important production goods and services but perhaps more importantly provides cost data used in calculating the index of prices paid by farmers at the U.S. level. Also included in the index of prices paid are interest, taxes and wage rates. The index of prices received for all farm products sold, when divided by the index of prices paid gives a measure of what farm products will buy in terms of production needs such as fertilizer and machinery, and family living needs.

The table below shows average prices paid by Illinois farmers for selected feeds and motor supplies in 1979 thru 1981. Beginning in January 1977, the Bureau of Labor Statistics Consumer Price Index (CPI) was used to measure farmers' costs for family living items. Therefore, data on family living costs are no longer collected by the Department of Agriculture.

State or regional prices paid for feed, seed, fuels, and fertilizer, and U.S. prices for all commodities are published currently in AGRICULTURAL PRICES, a monthly report of the Statistical Reporting Service of the U.S. Department of Agriculture, Washington, D.C. Regional prices for building materials, farm machinery, farm supplies, and pesticides, and State prices for motor supplies are first published in the Annual Summary in June of the following year. These publications are available upon request to the United States Department of Agriculture, Statistical Reporting Service, Washington, D.C. 20250.

PRICES PAID: Average prices paid by Illinois farmers, December 15, 1979-81 1/

Item and unit	1979	1980	1981
		Dollars	
		FEED	
Soybean meal, 44% protein, 100 lbs.	13.00	17.00	14.00
Laying feed "complete feed" per ton	205.00	245.00	205.00
Chick starter feed, per ton	220.00	265.00	235.00
Dairy feed, 16% protein, per ton	175.00	215.00	196.00
Hog concentrate, 38-42% protein, 100 lbs.	14.50	17.60	15.70
Beef cattle concentrate, 32-36% protein, 100 lbs.	11.50	13.50	12.10
		MOTOR SUPPLIES 2/	
Gasoline, filling station, unleaded, per gal.	1.07	1.30	1.41
Diesel fuel, per gal.	.90	1.03	1.22
Motor oil, all-weather, (high detergent) per gal.	4.40	5.50	5.60
Grease, 35-lb. pail	24.50	32.00	34.50
Tires, auto, each			
Bias-belted, G78-15	51.00	52.00	3/52.00
Radial, steel belted, 205-15 GR78-15	78.00	80.00	4/74.00
Tires, truck, 9.00 - 20, 10-ply, each	150.00	175.00	185.00
Tires, tractor, rear, 15.5 - 38, 6-ply, each	285.00	305.00	340.00
Storage batteries, CPR 220-310 AMPS	55.00	57.00	53.00
Anti-freeze, permanent, per gal.	4.85	5.30	5.20

1/ Averages at independent and chain stores. 2/ October 15. 3/ Tire size - E 78-14. 4/ Tire size - P 195/75 R 14, E R 78-14.

OTHER DATA SERIES

This section contains data series which did not fall under other major category headings. Included in this bulletin are fertilizer information, and farm employment and wage rates.

1/ This fertilizer information was obtained when interviewing farm operators for Objective Yield Surveys conducted by the Statistical Reporting Service and are not official estimates of total fertilizer use. The samples are relatively small and the data are subject to sampling fluctuation. 2/ Percentages apply to acres receiving fertilizer, not to total acres harvested.
